

ABSTRACT

Environmental problems are problems that are common and become a scourge for the State. This is due to the lack of awareness of the community in maintaining and managing their environment. The causative factors can be due to changes in function and environment, decreasing carrying capacity and and quality of the environment, less optimal and synergy of various parties in the management of human resources, nature, environmental pollution caused by garbage. The problem of waste in the village is also caused by the waste dumped into the villages from nearby cities. Waste management still lacks optimal attention from the community and the local government so that it causes various kinds of environmental problems such as the emergence of diseases, the accumulation of waste in waterways or rivers which will cause flooding, decrease in soil organic matter, and consequently decrease the quality of land agriculture, until finally global warming occurs. Therefore we need a strong commitment from various parties in dealing with environmental problems caused by this waste. The role of the community is very important in waste management not only limited to disposing of garbage in its place but also in its management so that it will ultimately provide economic benefits. As one form of responsibility in implementing the Tridharma, it is necessary to conduct a community service program in the form of training on waste management for organic waste into compost. As well as skills training in producing handicraft products from inorganic waste such as plastic and others.
